
TASK FOUR: TECHNICAL DOCUMENT

Michela Mifsud

LOGIN AND REGISTRATION

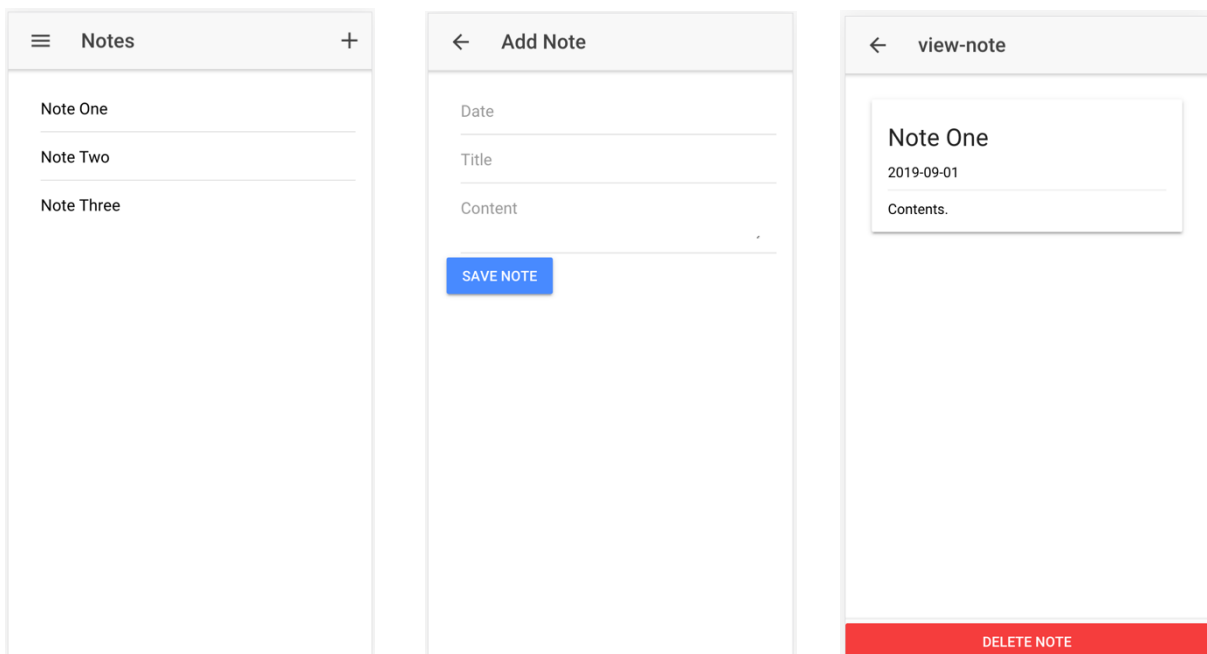

The HTML for these pages is present, but the registration does not operate due to the application not being connected to a database. The login was meant to have a hardcoded email and password, but I was not able to make it work properly as I kept running into several issues. Instead the Login Button leads into the Home Page, or the Newsfeed.

NEWSFEED

The two posts present are hardcoded and the Create post text box is available to use but the posts cannot be updated.

NOTES

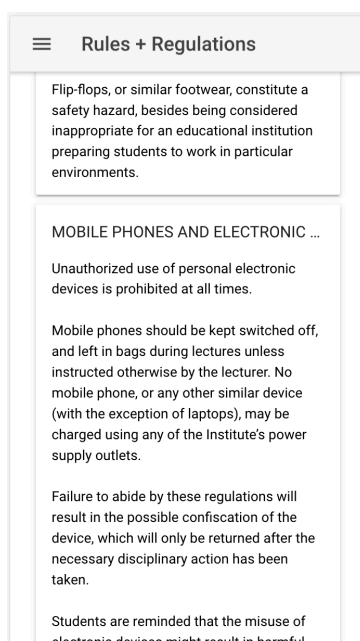

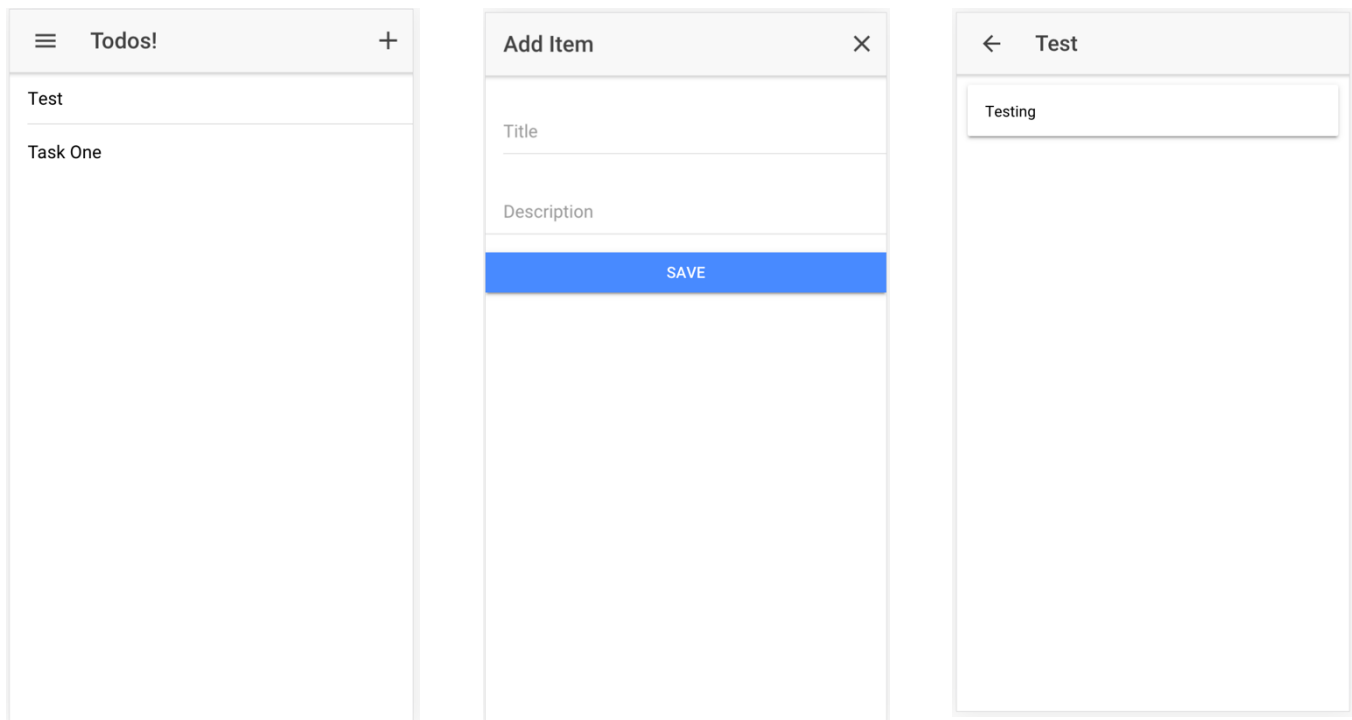

Notes are able to be added and deleted. On the notes page the title of the note will appear, and when it is clicked upon, the user is taken into the View Note page and they are able to view more detail, including the content of the note and the date they have set the note for. There they are also able to delete the note from the local storage. If the '+' on the right-hand side is pressed the user is taken into the Add Note page

TASKS

Tasks are able to be added. On the Tasks page the tasks list will appear, and when it is clicked upon, the user is taken into the View Task page and they are able to view more detail. If the '+' on the right-hand side is pressed the user is taken into the Add Note page

The notes and tasks are both stored in Ionic's local storage and therefore will remain in the application even if the session is terminated.

RULES

The rules page is hardcoded into the application; each section of rules is encased in a card to make the page look more presentable.
